

Beverage

Shipping in containers is a cost efficient and safe way of transporting most types of cargo. But putting goods into a container also involves a constant risk of moisture damage for almost all kind of cargo on every voyage.

is a company with global reach headquartered in Sweden. We are helping partners around the world solve their moisture protection issues utilizing our global supply chain and support network. We have assigned specialists for all major industries to come up with a moisture protection solution tailored to your specific needs.

ABSORINSIGHT

Moisture damage is a common and costly problem for the beverage industry. The outer packaging is often being what is exposed on the shelves in the Supermarket. A damaged box is normally not sellable. In addition, a bottle with a peeling label is not attractive to the consumer and has a negative impact on your company brand. Further, a cardboard box corner softened by moisture may cause your cargo to tilt, adding a lot of indirect costs when unloading.

An easy and cost-efficient solution is to use desiccants to absorb the excess moisture during shipment, meaning the goods are arriving in the same condition as loaded. By using container desiccants to absorb the excess water the moisture damage can be eliminated. Our desiccants are using calcium chloride which significantly outperforms traditional methods. In order to save you time and money and make the process safe we have also developed simple but efficient installation tools for our AbsorRange™ desiccant solutions. These accessories will allow you to dress a container in minutes. Speed and safety are important in a high volume business like beverage.

Typical moisture damages

-  Peeling labels
-  Damaged packaging
-  Collapsed packaging
